

Using CFSv2 for long range pattern change and hydrological potential

Alex Tardy- NWS San Diego
Alexander.Tardy@noaa.gov

Decision makers want long range prediction beyond week 1

Need for long range forecasting has increased due to better forecasts in the short range and more extreme extended climate periods (dry and wet)

Using Climate Forecast System

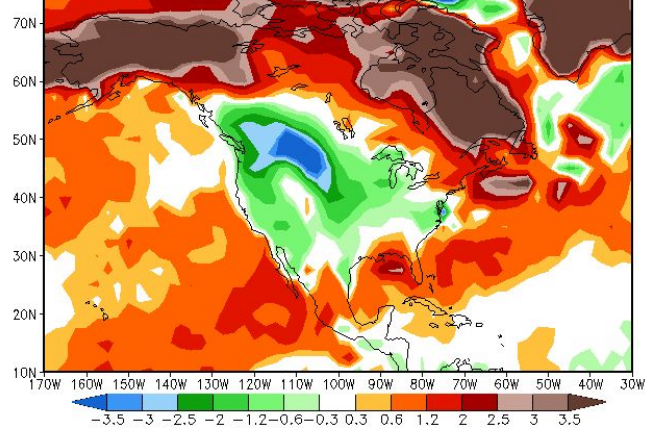

Daily output – 16 member ensemble mean anomalies

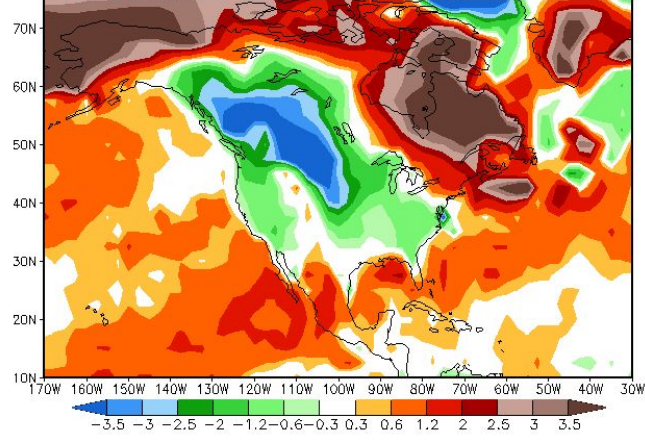

Temperature

Precipitation

CFSv2 Extended Range Temperature
16 Member Ensemble Mean Forecast from 11Feb2018
Week 3 Anomalies (K) 26Feb2018–4Mar2018

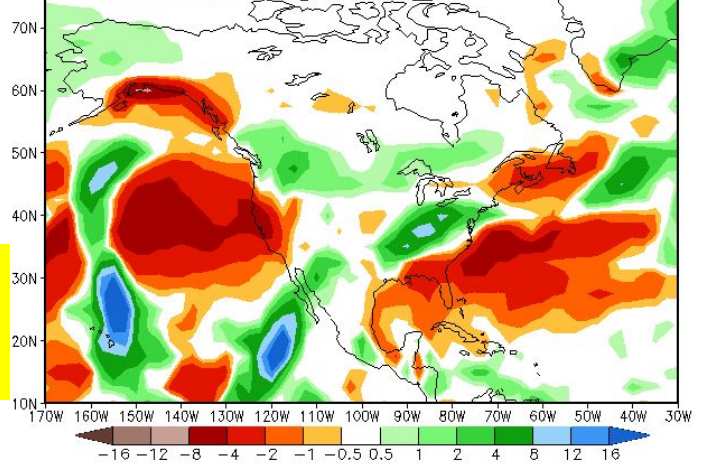

Week 4 Anomalies (K) 5Mar2018–11Mar2018

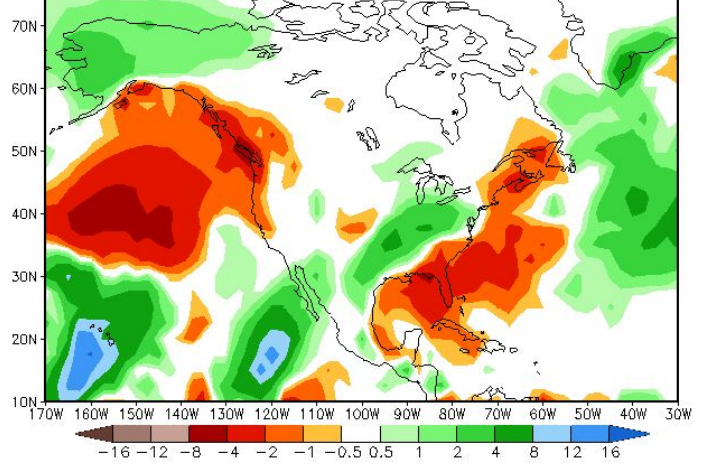

CFSv2 Weeks 1 & 2 Precipitation
16 Member Ensemble Mean Forecast from 14Feb2018

Week 1 Anomalies (mm/day) 15Feb2018–21Feb2018

Week 2 Anomalies (mm/day) 22Feb2018–28Feb2018

Green/blue = wet
Brown/red = dry

Building a Weather-Ready Nation

Atmospheric River and weak upper trough yielded orographic heavy rain

Long range forecasting Atmospheric River March 10-11, 2018

- The main trough was forecast to be weak (flat) and progressive
- The atmospheric river was well captured in the IVT (integrated water vapor transport over 500 into Orange and San Diego counties)
- The WPC, CNRFC and WFO forecasts were significant underforecast QPF prior to March 10
- March 10 WPC QPF and WFO QPF totals were doubled
- The rain was mostly 24 hours or less 4 pm Saturday to 1 am Sunday was the heaviest
- Drizzle and light rain (few hundredths) was widespread Saturday morning and afternoon on coast and inland valleys with upslope enhancement
- Orographic coastal slopes received 1.5 to 3.5 inches (Palomar Mtn highest)
- Spill over into High Deserts (0.25 to 0.50) and Coachella Valley (0.10 or less)
- Orange and Inland Empire received 0.50 to 0.90 inches, and only small shadow area near Perris

Summary of CFS use for long range forecasts

2nd International AR conference 2018

- Partners want long range information on a pattern change (dry to wet or wet to dry) more than Equal Chances
- CPC provides experimental **3 to 4 week forecasts** (tend to be very low probability and not daily)
- CFSv2 (daily) shows strong promise for weeks 2 to 3 and possibly week 4
- The 1-week anomaly (precipitation or temperature) can not be used for specific timing for location (proximity)
- The CFSv2 precipitation can we used for decision makers seeking potential for AR development in the Pacific Basin or unusual cold periods
- These cases showed up to 3-4 week lead time for AR development and potential landfall in California and the tropical Pacific
- Deterministic and ensemble data captured the AR strength and occurrence 180 to 240h – *moisture fields are only part of the process for hydrological forecasts*
- CFS week 2 to 4 during the historical strongest (2.6C) El Nino 2015-16 generally carried too much bet bias
